

• Fun on the Beach •

Lake McConaughy was built on the edge of the Nebraska Sandhills, the largest sand dune formation in the Western Hemisphere. The Sandhills were formed during a series of mega-droughts beginning at least 20,000 years ago during the last ice age. There was very little vegetation at the time, and desert winds shaped the dunes from sand that had been deposited by ancient rivers. Today, the white sand beaches make Lake McConaughy a great place to build sandcastles.
